

# Extensible FPGA Framework (EFW)

## For HiTech Global HTG-K830 Kintex-Ultrascale PCIe FPGA Module

### Key Framework Features

- Integrated, hardware verified solutions for 1G/10G/40G Ethernet development
- HTG-K830 module targeted system building blocks of DMA Controllers, Ethernet MAC and PCS, PCIe application interface, AXI4 Interconnect, DDR4 and Flash Memory controllers
- Frameworks bundled with:
  - **All options:** x4/x8 PCIe Gen3 PCIe application interface, AXI4-Lite master/arbiter for memory mapped interface, Field Upgradeable (FuP) controller for in-system Flash programming and I2C controller
  - **Selected Option Based:** Synthesizable binaries and full simulation libraries for high performance (up to 64Gbps) multi-channel DMA controllers paired with GiGE, low latency 10G, ultra-low latency 10G or 40G Ethernet
- Linux source code device drivers and APIs for PCIe interface and DMA controller
- Unified GUI for the entire EFW with scripting support
- Lowest startup cost for developing complete 1G, 10G and 40G solutions with Kintex Ultrascale FPGA
- Simplified, single-sourced licensing for all FPGA IP cores and drivers

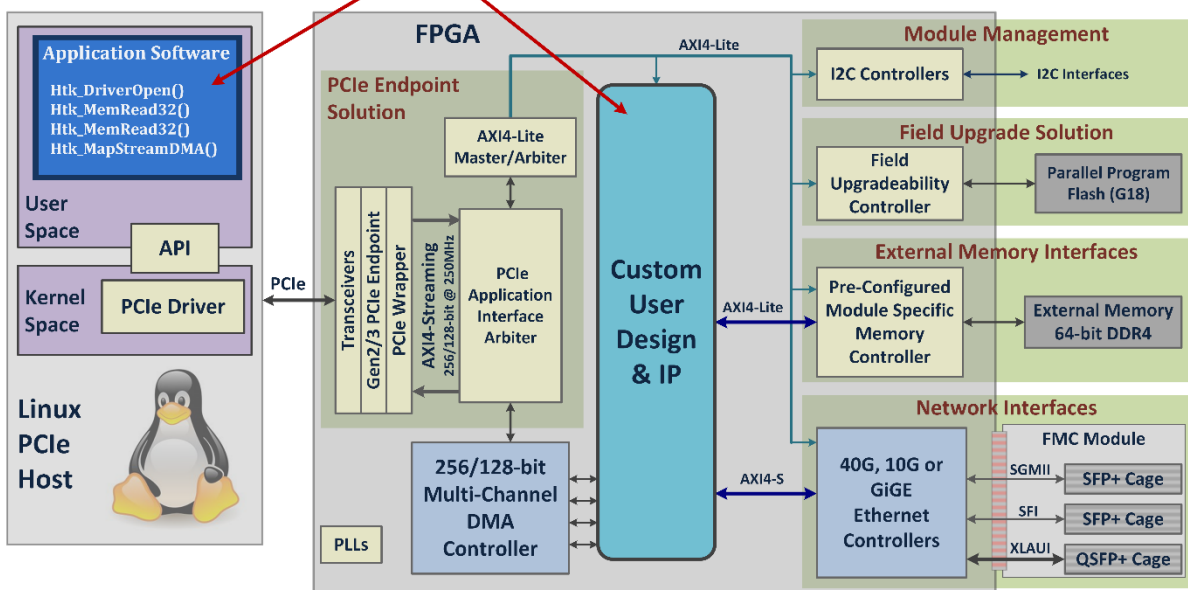

### QUICKEST AND HIGHLY AFFORDABLE 1G, 10G AND 40G ETHERNET DEVELOPMENT WITH HTG-K830 PCIe MODULE

Extensible FPGA Framework (EFW) empowers FPGA developers with a verified set of productivity solutions, including module targeted physical interface components, device drivers and APIs for the HiTech Global HTG-K830 PCIe module.

Frameworks save months of development and debug time by enabling developers to skip the tedious and time consuming phase of IP core integration, interface verification and firmware development.

Framework Bundled Content	Framework Type				Required FMC Module
	Base	1G	10G	40G	
Linux Device Drivers and APIs (Source)	●	●	●	●	-
x4/x8 PCIe Gen3 PCIe hard IP based PCIe application interface and arbiter (Verilog)	●	●	●	●	-
AXI4-Lite Master and Arbiter with 32-bit control plane for registers accesses (Verilog)	●	●	●	●	-
32-bit AXI4-Lite Slave for integrating user blocks (Verilog)	●	●	●	●	-
G18 Flash controller for in-system field upgrades (FuP) (Netlist)	●	●	●	●	-
I2C Controllers (Netlist)	●	●	●	●	-
Targeted DDR4 controllers with AXI4 wrapper (Verilog)	●	●	●	●	-
128-Bit 8-Channel PCIe RapidDMA with x4 Gen3 PCIe Endpoint (Netlist)		●	●		-
256-Bit 8-Channel PCIe RapidDMA with x8 Gen3 PCIe Endpoint (Netlist)				●	-
GiGE MAC with 1000Base-X Interface (Netlist)		●	●	●	FMC-X4SFP+
Low and Ultra-Low Latency 10G Ethernet, 32-bit data path (Netlist) <i>Latency optimized for financial market applications</i>			●		FMC-X4SFP+ FMC-SFP-OC
40G Ethernet, 128-bit data path (Netlist) <i>Area optimized for low resource utilization</i>				●	FMC-X2QSFP+ FMC-SFP-OC

Frameworks Take Care of the Rest  
Just Concentrate on "This" and "This"

## Productivity Features

**PCIe Bus Interface and Management:** Complete PCIe solutions for the HTG-K830 x4 Gen3 and x8 Gen3 PCIe interface. Framework implements up to two application side interfaces, a 32-bit AXI4-Lite compliant register access interface for Non-DMA (single read/write) operations and 256/128-bit AXI-4 streaming compliant interface for DMA operations.

**Parameterized AXI4-Lite Inter-connect:** Complete, fully parameterized 32-bit AXI4-Lite inter-connect with Master, Arbiter and Slave in source (Verilog) code for register access

**High Performance PCIe DMA:** 256-bit and 128-bit data path @ 250MHz (up to 64Gbps/32Gbps), multi-channel scatter-gather RapidDMA IP with AXI4 compliant user interface for high performance and low latency data transfers between host and module. Support for both Legacy and MSI interrupt mechanisms.

**Ethernet Solutions from GiGE to 40Gbps:** HTG-K830 targeted and fully verified Ethernet interfaces using GiGE, Optimal Latency 10Gbps and 40Gbps Ethernet solutions. Ethernet interfaces provided through Hitech Global HTG-FMC-X4SFP+, HTG-FMC-X2QSFP+ and HTG-FMC-SFP-OC FMC modules. Basic L2 packet generators and checkers (netlist) included for quick interface verification through GUI interface.

**BPI Flash Upgrade through PCIe:** Program and erase the parallel Flash memory on the HTG-K830 through the PCIe interface at very high speeds. Integrating the FUP controller allows any user design to be field upgradable through PCIe.

**Device Drivers:** 64-bit Linux device drivers in source code for DMA, register access and interrupts

**APIs:** C (source code) language function libraries and example test for DMA, register access and interrupts in source code

**GUI Interface:** GUI application (Linux only) for control and configuration of all EFW components
